

Cancer match trial in Glasgow gets 100th patient

A pancreatic cancer trial that aims to match patients with more targeted and effective treatments for their tumours has recruited its 100th patient.

The scheme is run by Precision-Panc, a research programme and clinical trials project led by the University of Glasgow with funding from the charity Cancer Research UK.

Under the project, each patient has a tumour biopsy, with the material then being used for molecular profiling at the university.

The results can then be used to help match patients to the most suitable treatment or clinical trial for them.
